New degas attachment and procedure for degas

1. Turn off all argon valves at the argon manifold.

2. Disconnect quick connect at the argon manifold.

3. Plug in mating part on new attachment and follow degas instructions. This will give you full flow of 10-15 psi. Check valves on argon manifold to prevent full flow and vigorous bubbling necessary for complete degassing.

4. After degassing, detach new attachment. Reconnect argon quick connect and turn on all argon valves.
