When the assignment is finally over and you log into your CPR page for the assignment, you will see:

- The limit of how far you can be away from the average and still have mastered the reviews and received full credit for your reviews of others.

- This number tells how far away your rating was from the weighted average of the review scores as set by all the reviewers of that paragraph.

- Click here to see the reviews you did of your peers' work.

- Click here to view your calibration results (if you did a recalibration, only the 2nd one is shown). It will look like this.

  - Anything that is underlined is clickable. So, you can revisit the calibration paragraphs, see your answers and the author's answers and click on why the author's made their decisions.
  - Near the top you see "65% Style" and "65% Content" - meaning you must get at least 65% of the style and content questions correct to master the calibration.
  - "Max.Dev. = 2.5" means your rating of the paragraph must be within ±2.5 of the rating given the paragraph by the assignment's author. To master the calibration, you must pass all 3 parts of it. For more details, see the back page, under Part 2.

- Click here to see your peers' explanations of why they gave you the score they did.

- Your paragraph's score is 2x the rating given it by your peers.

- Your total score for the assignment - it will count the same as a lab.

- The small arrow means you are looking at the "Results" page.

- This weight factor depends on how well the reviewer did on the calibrations. A person who did terribly on the calibrations has a weighting of 0 and doesn't affect your self-assessment score.

- If any scores appear in red at the bottom after a week or so, then Dr. Keeney-Kennicutt or some other qualified instructor has looked at a paragraph (either yours or your peers) and reassessed it. This may or may not change your final score. If you have any questions, or want your scores reassessed, contact her at kennicutt@mail.chem.tamu.edu.
