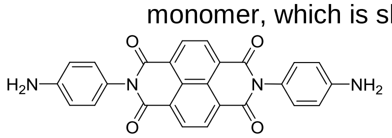
Final Exam, May 3, 2013, 100 pts
Polymer Chemistry, CHEM 466, Spring 2013
Texas A&M University, College Station, TX, USA

1. The copolyimide shown below was reported recently[1] to exhibit tunable optical and electronic properties through charge transfer between the AMTPA and NTCDI units. Memory devices constructed from a series of these copolymers, with variation in the x value, gave a change from "volatile dynamic random access memory to nonvolatile write once read many memory characteristics as the NTCDI composition increased".

   (a) Provide a retrosynthetic pathway by which this copolymer structure could be prepared. To avoid confusion, please note that the 6-membered ring imides are part of the NTCDI monomer, which is shown below. **[10 points]**



NTCDI monomer

[1] Kurosawa, T.; Lai, Y.-C.; Yu, A.-D.; Wu, H.-C.; Higashihara, T.; Ueda, M.; Chen, W.-C. Effects of the Acceptor Conjugation Length and Composition on the Electrical Memory Characteristics of Random Copolyimides", *J. Polym. Sci, Part A: Polym. Chem.* **2013**, *51*, 1348-1358.

Name:__________________________[printed]

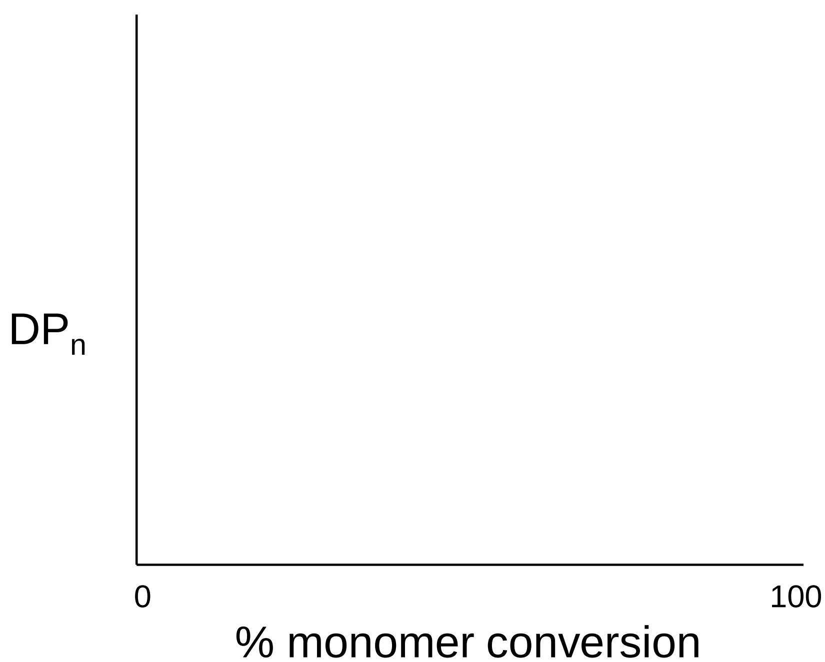
(b) State whether this copolyimide is a random/statistical copolymer or a block copolymer. **[2 points]**

(c) State whether the polymerization step of your retrosynthesis would proceed by a chain-growth or step-growth process. **[2 points]**

(d) State whether your polymerization would be controlled or un-controlled. **[2 points]**

(e) State whether the molecular weight distribution would be expected to be narrow or broad. **[2 points]**

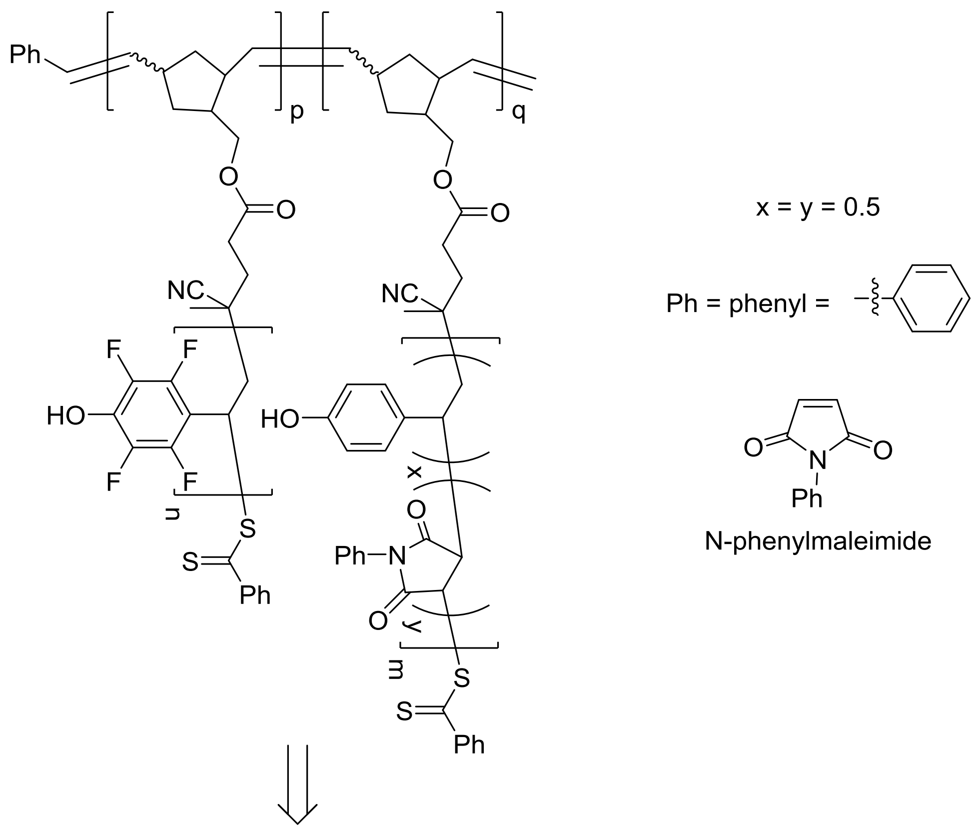
(f) Draw the expected DP_n *vs*. % monomer conversion plot on the axes below. **[4 points]**



(g) Predict the thermal characteristics for this polymer, in terms of thermal transition temperature(s) and thermal decomposition temperature(s), and explain. **[4 points]**

2. As promised during lecture, this question requires that you provide a retrosynthetic analysis for the following molecular brush, which is prepared by a combination of RAFT polymerization and ROMP. Please note a few points: i) the termination step was not shown explicitly during the discussion of this molecular brush, but was illustrated during the final lecture of the course; ii) the chemical structure for N-phenylmaleimide is given and may be of use; iii) although the mechanism for RAFT polymerization was illustrated during lecture for a trithiocarbonate chain transfer agent, the mechanism is the same for the dithioester functionality.

   (a) Provide a retrosynthetic pathway for the preparation of this molecular brush (your answer can continue onto the next page). **[15 points]**



(b) Given that x = y = 0.5 and the styrene and N-phenylmaleimide units are alternating for the copolymer graft, predict the reactivity ratio values for the copolymerization of *p*-hydroxystyrene (1) and N-phenylmaleimide (2). **[2 points]**

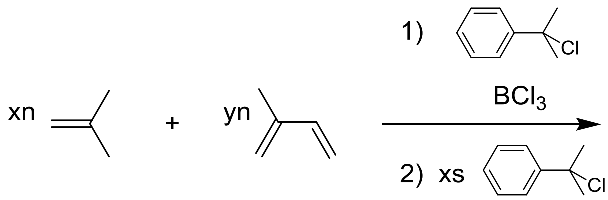
r_1 =

r_2 =

(c) Choose one of your RAFT polymerization steps and draw the electron arrow-pushing mechanism for the RAFT polymerization, labeling all initiation, propagation and (reversible) termination steps. **[6 points]**

Name:__________________________________[printed]

3. For the following cationic chain-growth, addition copolymerization:

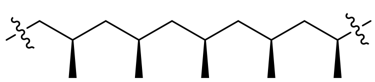


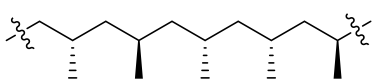
(a) Provide the products. **[10 points]**

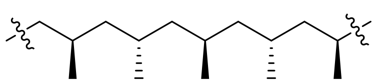
(b) State which regioisomer for the isoprene repeat units is favored, and state and illustrate mechanistically the reason for your answer. **[5 points]**

(c) State at least one product in which this copolymer could be found, *e.g.* name the item that was shown during lecture. **[2 points]**

4. (a) For the following polypropylene segments, label their tacticities and predict whether they are likely to pack into crystalline or amorphous domains. **[12 points]**







(b) Describe the key features of the system that we discussed as being used by Dow to obtain olefin block copolymers with alternating semicrystalline and amorphous segments. **[6 points]**

Name:__________________________[printed]

5. For quiz #10, several students expressed interest in the broad range of applications for super glue, including those beyond typical daily applications, *e.g.* in the medical field, forensics, *etc*., and requested that a final examination question involve super glue. Therefore,

   (a) provide the chemistry for any version of an α-cyanoacrylate "super glue", including the monomer, initiator, mechanism of polymerization and the final polymer product structure; **[12 points]**

   (b) state what kind of polymerization is involved; **[2 points]**

   (c) state why this polymerization does not proceed while the monomer is stored in a closed tube. **[2 points]**

Equations, which may be of use:

Number-average molecular weight:

$$M_n = \frac{\Sigma N_x M_x}{\Sigma N_x}$$

$$N_x = \text{\# moles of polymer chains having molecular weight, } M_x$$

Weight-average molecular weight:

$$M_w = \Sigma w_x M_x = \frac{\Sigma N_x M_x^2}{\Sigma N_x M_x}$$

$$w_x = \text{wt fraction of polymer chains having molecular weight, } M_x = \frac{N_x M_x}{\Sigma N_x M_x}$$

Degree of polymerization:

$$DP_n = \frac{1}{1 - c}$$

c = extent of conversion of functional groups

$$DP_n = \frac{[\text{monomer}]_0 \cdot \% \text{ monomer conversion}}{[\text{initiator}]_0 \cdot f}$$

Polydispersity index:

$$PDI = \frac{M_w}{M_n}$$

Critical extent of reaction:

$$p_c = \frac{2}{f_{av}}$$

Average degree of monomer functionality:

$$f_{av} = \frac{\Sigma N_i f_i}{\Sigma N_i}$$
