Exam II, February 24, 2011, 125 pts  
Polymer Chemistry, CHEM 466, Spring 2011  
Texas A&M University, College Station, TX, USA

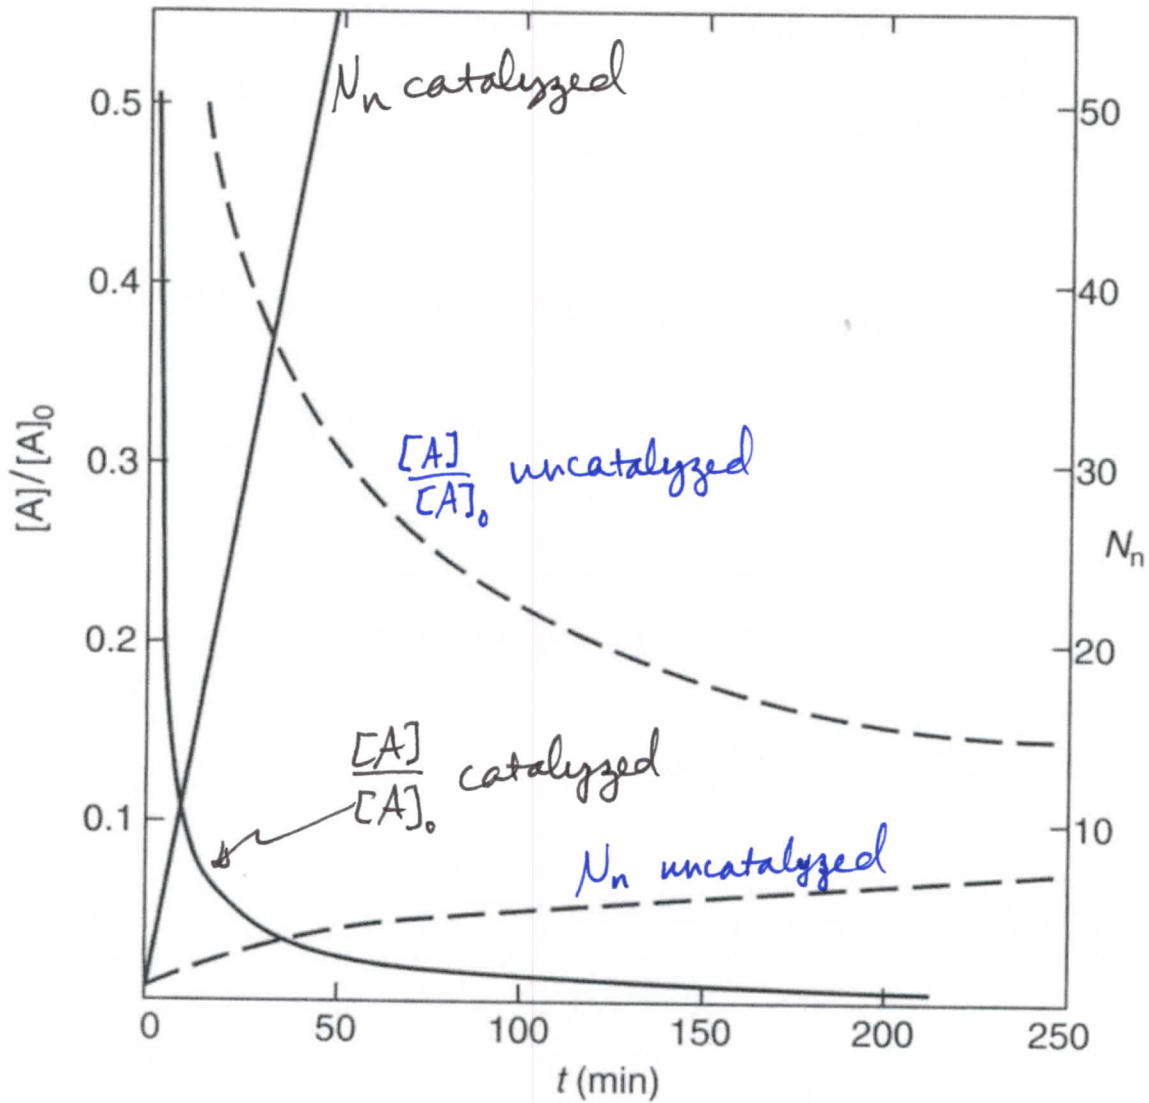

1. As described in the textbook (Hiemenz, P. C.; Lodge, T. P. *Polymer Chemistry*, 2nd Edition; CRC Press, Taylor & Francis Group: Boca Raton, FL, USA, 2007) problem 2.3, heating of  $\beta$ -carboxymethyl caprolactam at 270 °C promotes isomerization to an AB monomer, which then undergoes polymerization to afford a polyimide.

- (a) Provide balanced chemical reaction equations that illustrate the chemical structures for the polymers and any condensation by-products for the two stages of polymerization shown below. [10 points]

it is difficult to draw the parantheses, w/out exaggeration of the bonds

- (b) Label the four plots of the figure below (Figure 2.4 of the textbook) to indicate which data are  $[A]/[A]_0$  vs. time and  $N_n$  (also called  $DP_n$ ) vs. time for a catalyzed AB polymerization reaction and which data are  $[A]/[A]_0$  vs. time and  $N_n$  vs. time for an uncatalyzed AB polymerization reaction. [8 points]

2. For the polycarbonate structure and  $^1\text{H}$  NMR spectrum given:

[you can see that 3H<sub>c</sub> is actually (3n)H<sub>c</sub> and 1H<sub>d</sub> is actually (1n+1)H<sub>d</sub>]

(a) Determine the degree of polymerization. [15 points]

use 9H<sub>a</sub> or 6H<sub>b</sub> for det'm of chain end relative #

$$\text{for } 9H_a: 9H_a = 4\text{mm} \Rightarrow H_a = 0.44$$

use 3H<sub>c</sub> or 1H<sub>d</sub> for det'm of repeat units (H<sub>d</sub> complicated by 1 chain end too)

$$\text{for } 3H_c: 3H_c = 19\text{mm} \Rightarrow H_c = 6.33$$

$$\frac{H_c}{H_a} = 14.4 \Rightarrow \underline{\underline{DP_n = 14}}$$

(b) Calculate the number-average molecular weight. [10 points]

repeat unit is  $\text{C}_{25}\text{H}_{18}\text{N}_2\text{O}_5$ ; ignoring isotopic abundances

$$\text{repeat unit mass} = 426 \text{ g/mol}$$

chain ends are  $\text{C}_6\text{H}_{15}\text{Si}$ , mass = 115 g/mol

$\text{C}_3\text{H}_3\text{N}_2$ , mass = 67 g/mol

$$\left. \begin{array}{l} \text{repeat unit mass} = 426 \text{ g/mol} \\ \text{chain ends are } \text{C}_6\text{H}_{15}\text{Si}, \text{ mass} = 115 \text{ g/mol} \\ \text{C}_3\text{H}_3\text{N}_2, \text{ mass} = 67 \text{ g/mol} \end{array} \right\} M_n = 14(426 \text{ g/mol}) + 115 \text{ g/mol} + 67 \text{ g/mol} = 6146 \text{ g/mol}$$

w/2 sig figs

$$\Rightarrow \underline{\underline{6100 \text{ g/mol}}}$$

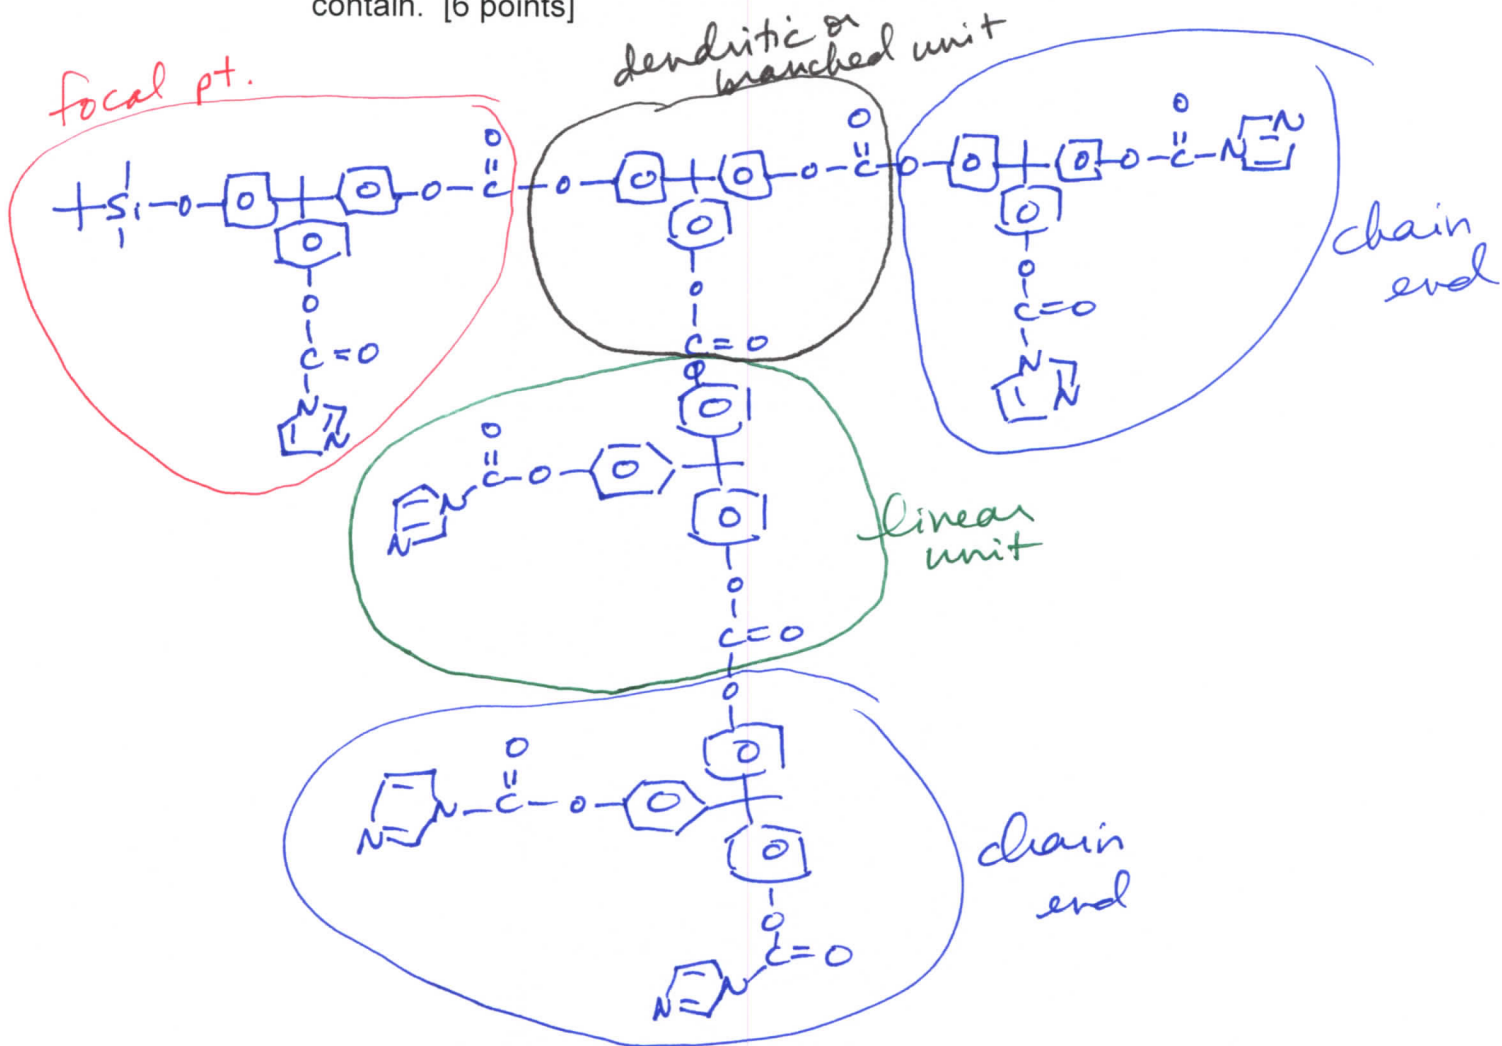

- (c) Provide the structure for a monomer that could be used to produce this polymer. [5 points]

- (d) Based upon your monomer and the wavy line included in the structure above, state the type of macromolecular architecture of this polycarbonate. [2 points]

*hyperbranched polymer*

- (e) Draw-out the chemical structure, showing a sufficient number of repeat units to be able to illustrate the four different types of units that this structure may contain. [6 points]

- (f) Label those different types of units upon your structure above. [4 points]

3. For the silicone adhesive components shown below:

(a) Draw the chemical reactions that are involved during the curing of the materials. [10 points]

(b) Draw the structure for the crosslinked network product. [10 points]

(c) Calculate the gel point (reminder:  $p_c = 2/f_{av}$  and  $f_{av} = \frac{\sum N_i f_i}{\sum N_i}$  for a stoichiometric balance of functional groups). [5 points]

for  $A_3 + B_2$ , stoichiometric balance requires  $2 A_3 + 3 B_2$

$$\Rightarrow f_{av} = \frac{2 \cdot 3 + 3 \cdot 2}{2 + 3} = 2.4 \quad \text{and} \quad p_c = \frac{2}{2.4} = 0.83 \Rightarrow \underline{\underline{83\% \text{ gel pt.}}}$$

4. Provide detailed electron arrow-pushing mechanisms that allow for the establishment of the amide and ester linkages in DSM's Hybrane<sup>®</sup> polyesteramides.

(a) Draw the mechanism for the reaction of phthalic anhydride with diisopropanolamine to give an initial  $\beta$ -hydroxyalkylamide. [6 points]

Add'n.  $\checkmark$

Elim.  $\checkmark$

(b) Draw the mechanism for the reactions between two of the initial  $\beta$ -hydroxyalkylamides, which involve an oxazolinium ion intermediate, to give the esteramide structure shown. [10 points]

(c) Suggest two applications that may take advantage of the hyperbranched polymer architecture, and the unique physical and chemical properties that result. [4 points]

the article by P. Fröhling, J. Polym. Sci., Part A: Polym. Chem. 2004, 42, 3110-3115. suggested several possibilities including polymer hosts for dyes, + use as additives to polypropylene fibers, crystallization inhibitors for oil recovery, paper coatings, and others; also see J. Fréchet article

from lecture.

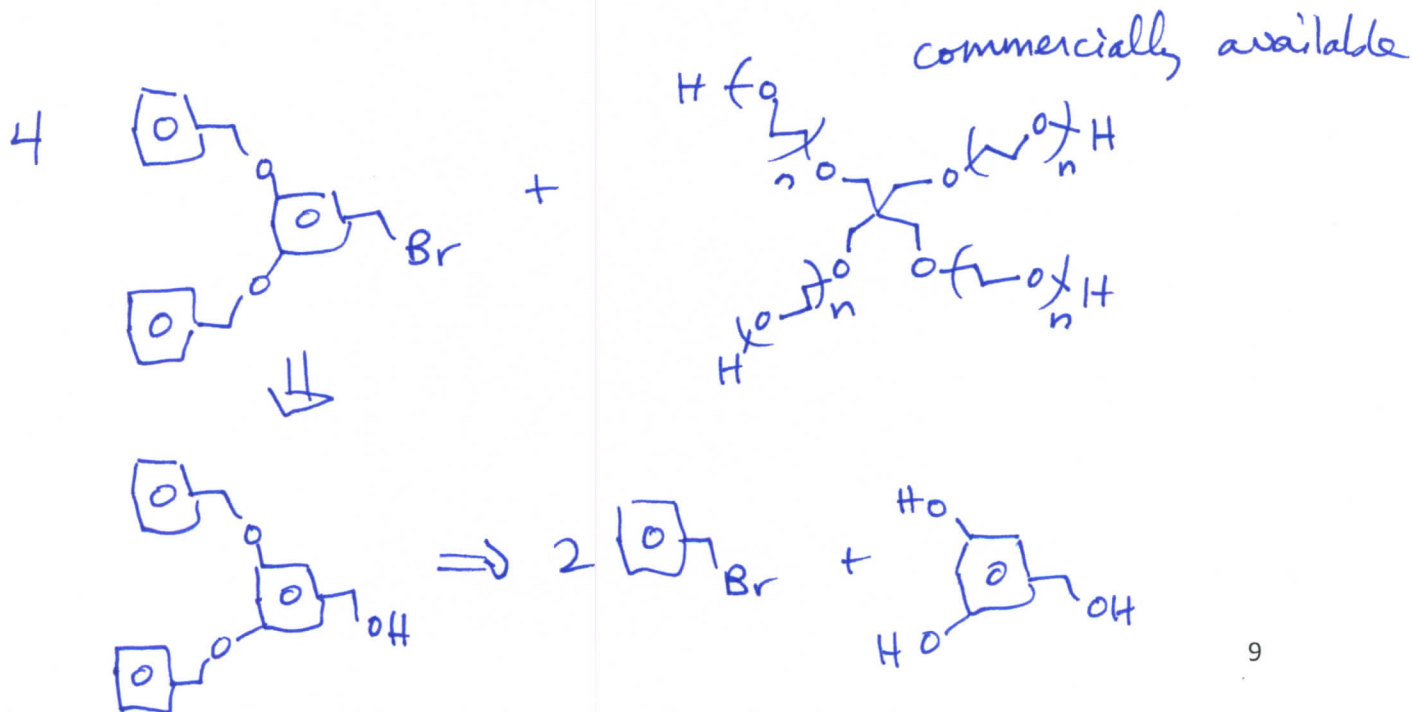

5. There are several errors in some of the chemical structures shown on page 160 of your textbook.

(a) Identify the errors by circling them in the structures above. [5 points]

(b) Provide a retrosynthesis for the following hybrid dendritic-linear star polymer structure. [15 points]

Equations, which may be of use:

Number-average molecular weight:

$$M_n = \frac{\sum N_x M_x}{\sum N_x}$$

$N_x$  = # moles of polymer chains having molecular weight,  $M_x$

Weight-average molecular weight:

$$M_w = \sum w_x M_x = \frac{\sum N_x M_x^2}{\sum N_x M_x}$$

$w_x$  = wt fraction of polymer chains having molecular weight,  $M_x = \frac{N_x M_x}{\sum N_x M_x}$

Degree of polymerization:

$$DP_n = \frac{1}{1 - c}$$

$c$  = extent of conversion of functional groups

Polydispersity index:

$$PDI = \frac{M_w}{M_n}$$

Critical extent of reaction:

$$p_c = \frac{2}{f_{av}}$$

Average degree of monomer functionality:

$$f_{av} = \frac{\sum N_i f_i}{\sum N_i}$$
